

ICT Terminal User Guide

Everything you need to use ICT Terminal: the ICT layers on the chart, the model scanner, drawing tools, alerts (also on WhatsApp), paper trading, the strategy tester, layouts with up to 8 charts and the phone app — step by step, with pictures.

📦 ICT concepts drawn for you

🎯 18 rule-based models

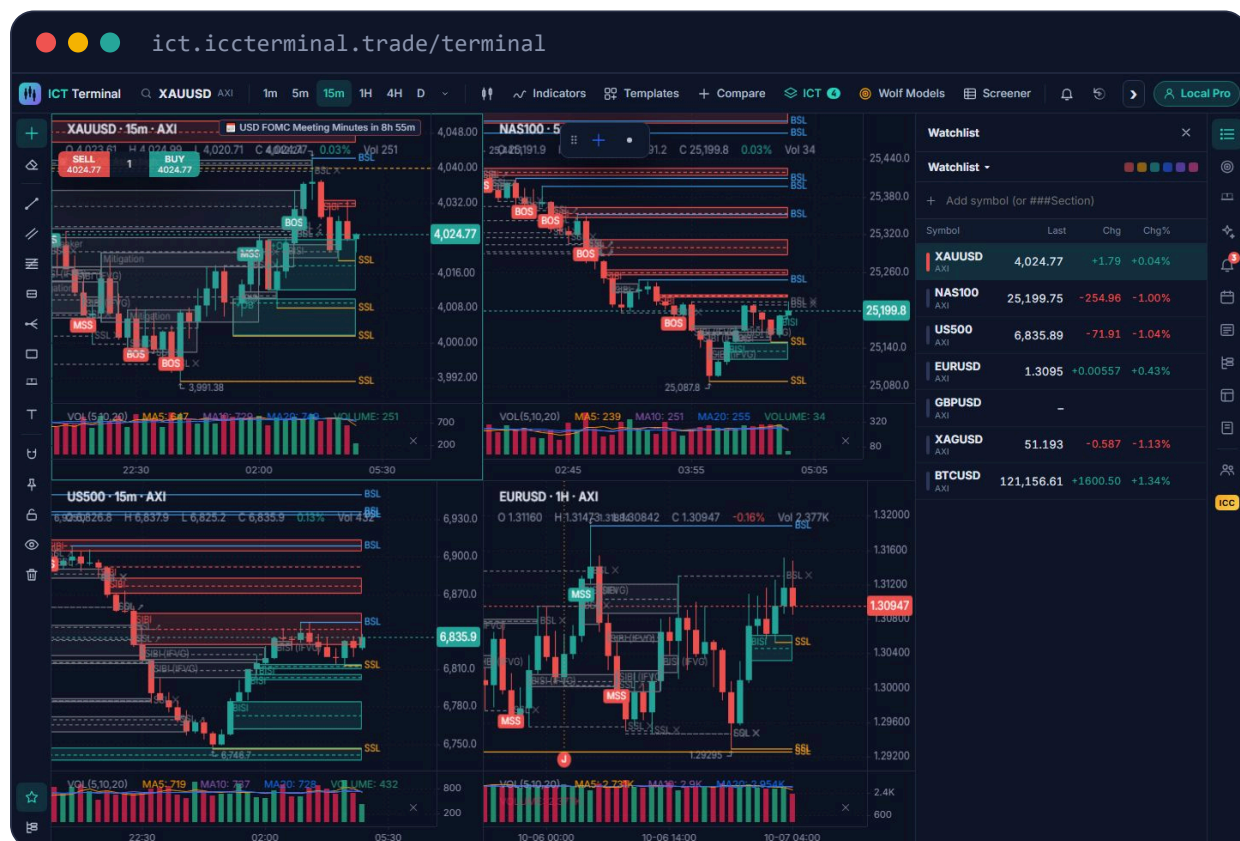

📱 Web, Android & Windows

🌐 14 languages

📘 Buttons, tabs and menus are written in English inside the terminal. This guide shows them exactly as you see them, in **bold>**.

01 What is ICT Terminal?

ICT Terminal is a charting terminal built for traders who use the **ICT (Inner Circle Trader)** concepts. It draws the concepts on the chart for you and scans the markets for rule-based ICT setups.

The terminal with four charts: top bar, drawing tools on the left, the right menu and the watchlist.

- **ICT layers:** fair value gaps (FVG / IFVG), order and breaker blocks, buy-side and sell-side liquidity, market structure (MSS / BOS), sessions and killzones, key opens, premium / discount and OTE, opening gaps, IPDA ranges, SMT and the daily bias.
- **Model scanner:** 18 ICT models (Silver Bullet, 2022 model, Judas swing, OTE, Unicorn, Power of 3, news aftermath and more), each written as fixed rules with entry, stop and targets.
- **A full terminal:** 1–8 charts per layout, 100 drawing tools, indicators, alerts, paper trading, a strategy tester, a screener, the economic calendar and a community.

i ICT Terminal does not trade for you unless you install the MT5 bridge yourself. Setups follow rules; many of them lose. Always test on a demo account first.

02 Getting started

Open ict.iccterminal.trade/terminal in Chrome, Edge, Firefox or Safari. Nothing has to be installed.

The screenshot shows the 'Your account' modal in the ICT Terminal web interface. The modal is titled 'Your account' and has a close button. It contains several sections:

- My plan:** Local Pro, Email: alpha@test.local, Status: active, Expires: 2026-11-06, Member since: 2026-10-06. Buttons: Upgrade or renew, Log out.
- What your plan includes:**
 - Charts per layout: 8
 - ICT indicators: Yes
 - Model setups: All models, real time
 - AI assistant: No
 - Alerts: 10 active
 - MT5 auto-trading: No
 - Backtests: Yes
- Subscriptions:**

Plan	State	Starts	Expires	Days left
Local Pro	Active	2026-10-07	2026-11-06	29
- Devices (1 of 3 used):**

Device	Type	Last seen
Web browser (this one)	Web terminal	10/7/2026, 12:06:11 PM

Your account: plan, what it includes, payments and devices.

1. Choose **Create account**, enter your e-mail and a password, or press **Continue as guest** to look around first.
2. The free plan opens straight away. To unlock every model in real time, open your account (the button at the top right) and choose **Upgrade or renew**.

3. Your screen — charts, drawings, indicators, watchlists and alerts — is saved to your account automatically and opens the same on every device.

Apps

- **Android:** download the app from the website (**Apps**). If Android asks, allow installing apps from your browser.
- **Windows:** the terminal in its own window; it installs itself on the first run.
- Both apps load the same terminal, so every new feature reaches them without a new download.

03

The screen

The terminal has four areas:

Area	What is there
Top bar	Symbol search, intervals, chart type, Indicators, Templates, Compare, ICT, Wolf Models, Screener , alerts, replay, undo / redo, layout, screenshot, full screen, settings and your account. When the bar is wider than the screen, use the mouse wheel or the < > arrows.
Left toolbar	Drawing tools in groups, the magnet, stay-in-drawing mode, lock / hide / remove all drawings.
Right menu	Watchlist, Signals, Trade, AI, Alerts, Calendar, News, Object tree, Data window , the journal and, below a line, Community and ICC .
Charts	One to eight charts. Click a chart to make it active: the top bar always works on the active chart.

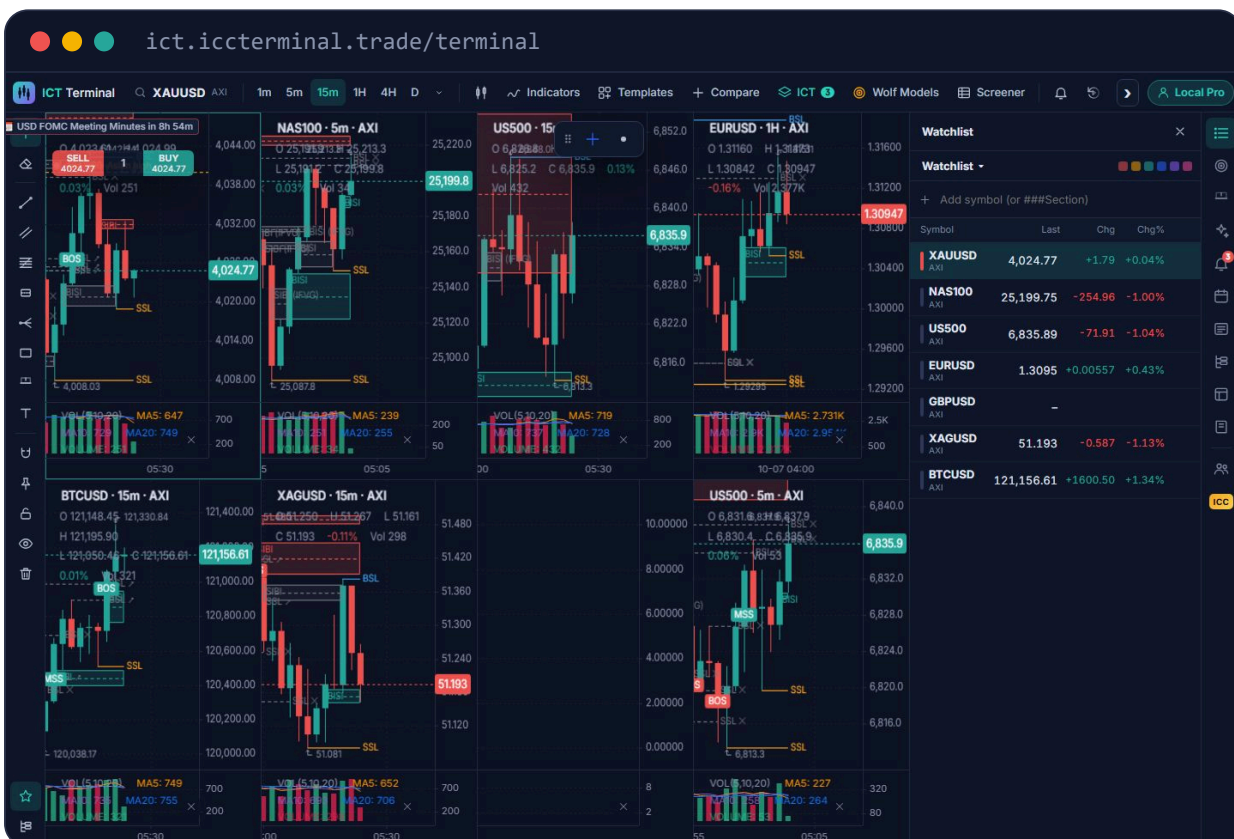

- ✓ Right-click a chart for the chart menu (go to date, chart type, price scale, new window, settings).
Right-click the price scale on the right for the price-scale menu.

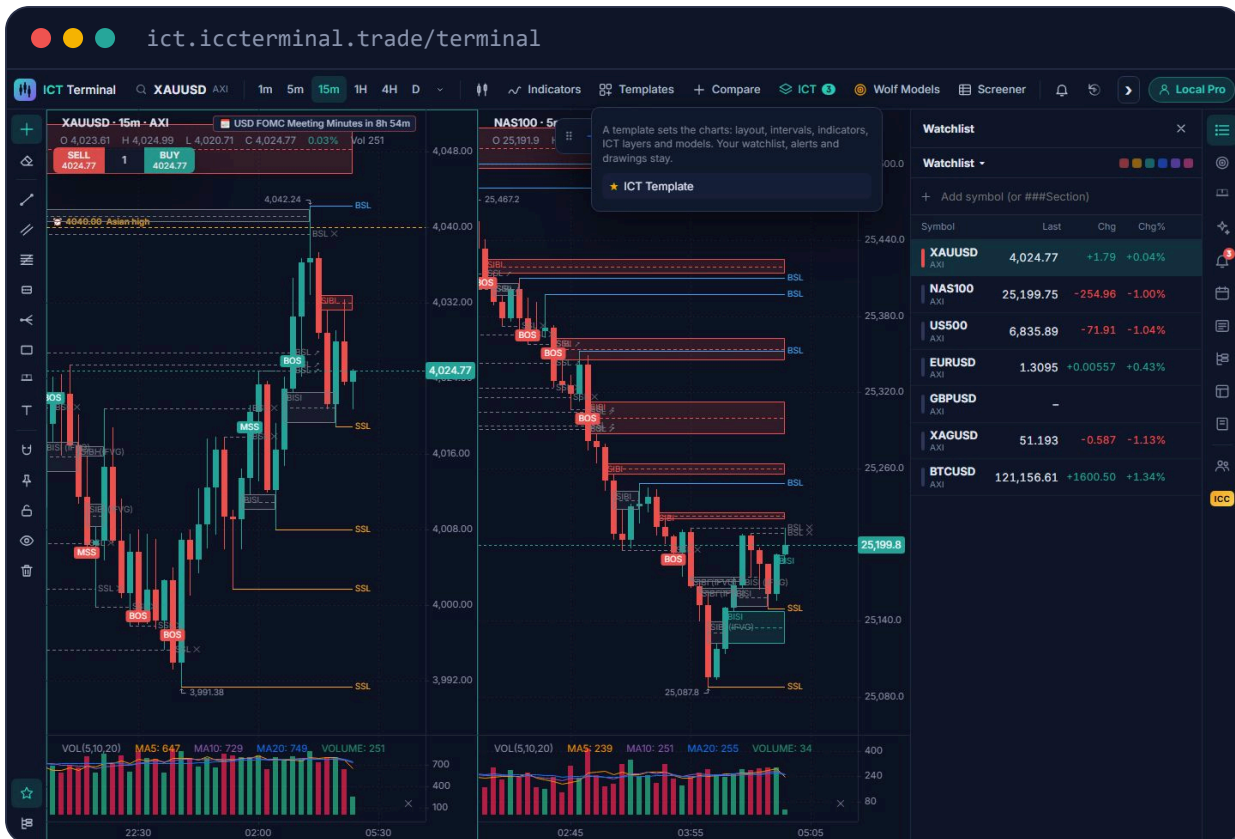

04

Charts, layouts and templates

- **Symbol:** click the symbol at the top (or just start typing on the chart) and search. Click the symbol in a chart's title to change only that chart.
- **Interval:** 1m to monthly, or type a number (for example **90** or **2h**) for a custom interval.
- **Chart type:** candles, hollow candles, Heikin Ashi, bars, line, area, Renko, line break, range bars, baseline and columns.
- **Layout:** the layout button at the top right offers 1, 2, 3, 4, 5, 6, 7 or 8 charts (as many as your plan allows). Sync symbol, interval and crosshair between charts there too.
- **Close a chart:** the X in its corner. **One chart big:** layout menu → **Show only the active chart**.
- **Templates:** a ready chart setup — layout, intervals, indicators, ICT layers and models — in one click. Your watchlist, alerts and drawings stay.
- **Saved layouts:** layout menu → **Save as...**; open them again from the same menu on any device.
- **New window:** right-click → **Open this chart in a new window** (for a second monitor).
- **Go to date:** right-click → **Go to date...** or Alt+G. **Bar replay:** the replay button in the top bar.

Up to eight charts in one layout, each with its own symbol and interval.

Templates: ready chart setups in one click. The ★ one is what new members start with.

Price scale

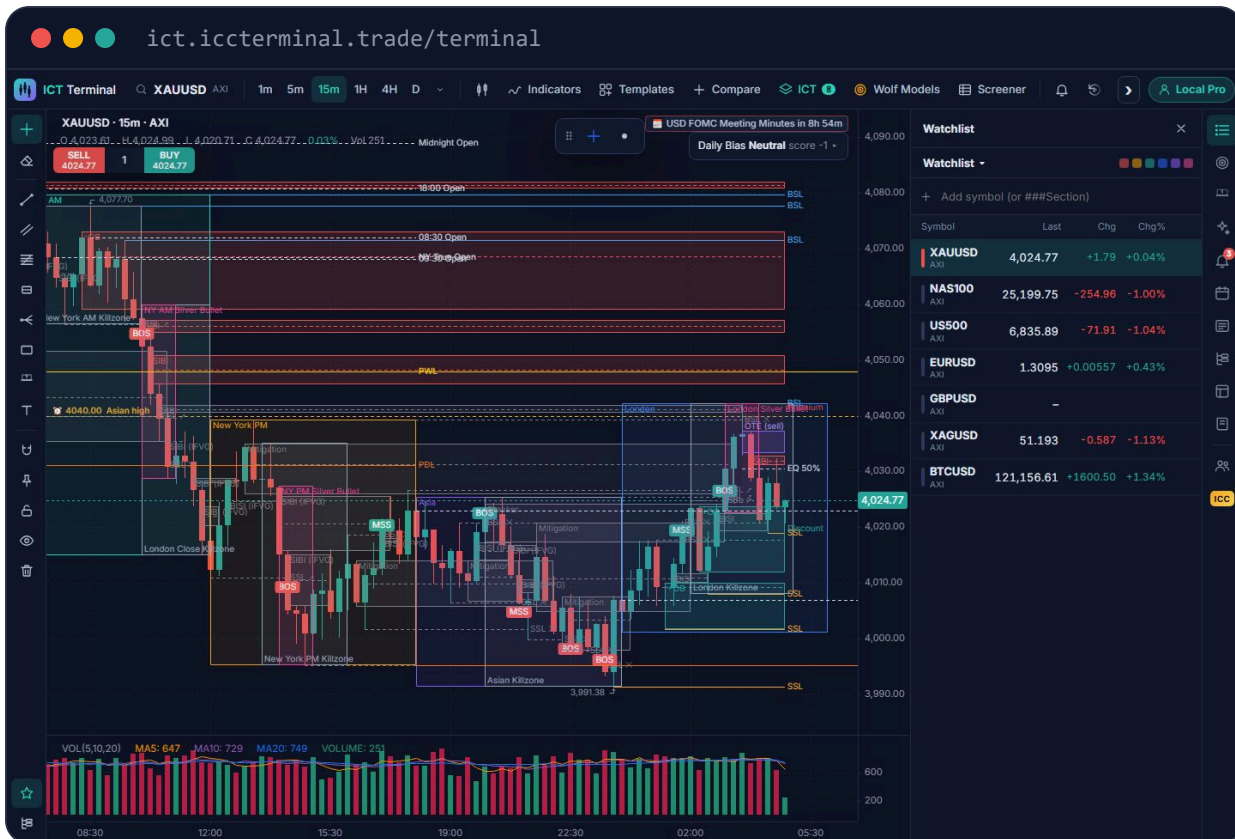

Right-click the price scale: **Auto (fit)**, **Lock range** (the scale stays while you scroll), **Lock price / bar** (the same price per bar when you zoom), **Regular**, **Log**, **Percent**, **Invert** and the side of the scale.

History: daily and weekly charts go back many years, and every candle follows New York time (the day starts at 18:00). There are 18 chart types, High-Low and Kagi included.

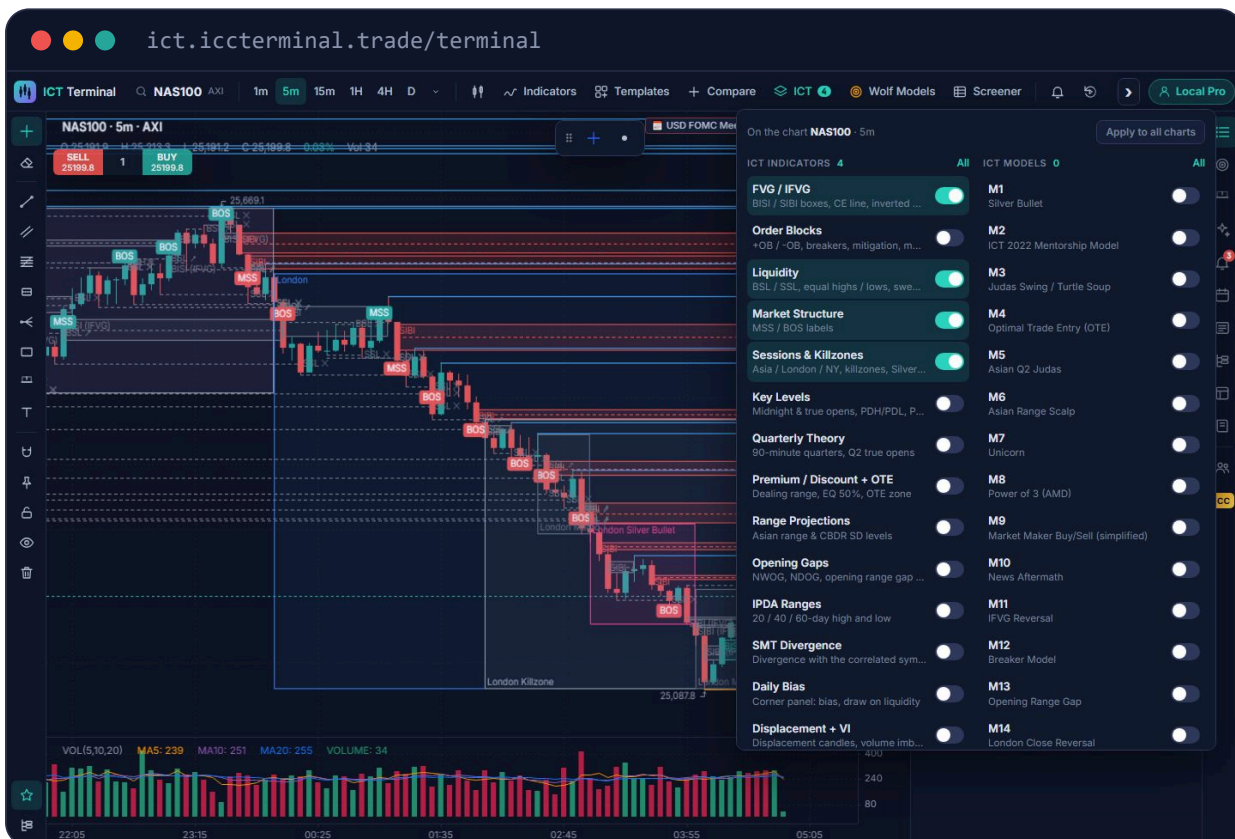

Export chart data (CSV): right-click the chart → *Export chart data* saves the bars (time, open, high, low, close, volume) as a CSV file. The **Screener** button now sits in the right rail, right under Signals.

05 ICT layers

Open the **ICT** menu in the top bar and switch on the layers you want. They are calculated by the engine for the symbol and interval of each chart.

ICT layers on gold 15m: FVGs, order blocks, liquidity, structure, sessions, key levels, premium / discount and the daily bias.

The ICT menu: switch each layer and each model on or off with one click.

Layer	What it shows
FVG / IFVG	Bullish (BISI) and bearish (SIBI) fair value gaps with the 50% line (CE). A gap that price closes through becomes an inversion FVG.
Order blocks	The last opposite candle before a displacement; failed ones become breaker blocks.
Liquidity	Buy-side (BSL) and sell-side (SSL) liquidity at swing highs / lows and equal highs / lows, marked when swept.
Structure	MSS (market structure shift, against the trend) and BOS (break of structure, with the trend).
Sessions & killzones	Asia, London and New York, the killzones, the Silver Bullet windows and the 90-minute quarters, in New York time.
Key levels	Midnight and 08:30 opens, previous day / week highs and lows.
Premium / Discount + OTE	The dealing range, its 50% (equilibrium) and the 62–79% optimal trade entry zone.
Projections, gaps, IPDA	Standard deviations of the Asian range and CBDR, NWO / NDO opening gaps, the 20 / 40 / 60-day ranges.
SMT, displacement, bias	Divergence against the partner market (gold–silver, Nasdaq–S&P), big displacement candles, and the daily bias panel with the draw on liquidity.

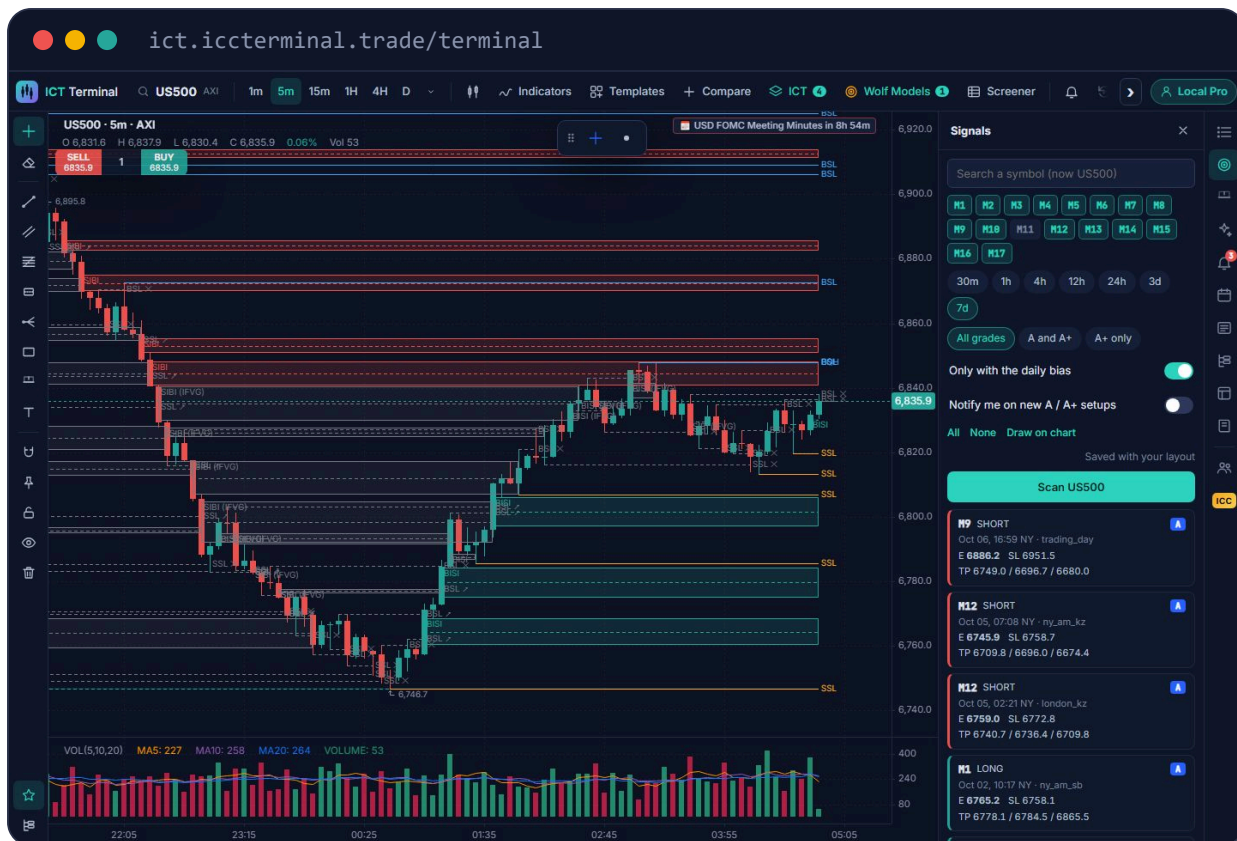

✓ Too much on the chart? Switch layers off per chart, or change the colours in **Settings**.

06

Model scanner and signals

The engine scans the markets with every model and stores each setup with its entry, stop, targets, grade and checklist.

The **Signals** tab lists the setups of your models; click one to see entry, stop and targets on the chart.

1. In the **ICT** menu, tick the models you want to see on a chart. Their setups are drawn as boxes with entry, stop and targets.
2. Open **Signals** on the right: pick the models, the time span (30 minutes to 7 days), the grade (all, A, A+) and whether only setups **with the daily bias** count.
3. Click a signal to jump to it on the chart. Turn on **notify** for a sound and a desktop notification on new A / A+ setups.
4. The journal (bottom panel) shows how each past setup ended: TP1-TP3, stop, breakeven or not filled, with the R result.

Grade	Meaning
A+	Every point of the model's checklist is met, including the daily bias.
A	One point is missing.
B	A valid setup with more points missing: for study rather than for trading.

⚠ No model has a proven edge yet. M11 (IFVG reversal) is off by default because it tested weakest; you can still choose it. Results of the past do not promise future results.

Wolf Models (top bar) holds custom models built from a trader's own rules: **M17 Wolf Asia Session (NDOG)** for NAS100 / US500, only between 19:00 and 22:00 New York, and **M18 The Alpha Model Gold** for XAUUSD

in London (02:00–05:00) and New York (07:00–10:00), with its bias from the dollar index, silver and gold. They draw on 1-minute charts.

07

Drawing tools

- Lines, Fibonacci (with the ICT levels 0.62 / 0.705 / 0.79 and the extensions), channels, pitchfork, Gann fan, XABCD / ABCD, head and shoulders, Elliott waves, shapes, text and notes.
- ICT tools: FVG box with CE, order block with mean threshold, liquidity line (BSL / SSL), OTE tool, dealing range and killzone box.
- Measure: long / short position with risk-reward, price & date range, date range, anchored VWAP and **Fixed range volume profile**. Shift + click on the chart measures quickly.

Settings of a drawing

Double-click a drawing (or press the gear on its small bar) for **Style**, **Text**, **Coordinates** and **Visibility**. In **Visibility** you can show a drawing only on chosen intervals — for example a 1H FVG only on 1m–15m charts.

✓ Select a line or a box and press  on its bar to create an alert from it.

Drawing settings like TradingView

- **Fib tools:** a table of 24 levels (on / value / colour), trend line, background, extend left / right, reverse, prices, levels as values or percents, label position and font size.
- **Lines and boxes:** solid, dashed or dotted, extend, arrow ends, price labels, stats (change, %, bars, time) and text; rectangles with background on / off, a middle line and extend.
- **Long / Short position:** account size, risk in % or money, lot size and quantity, profit and stop colours.
- **Copy and paste:** select a drawing and press **Ctrl+C** then **Ctrl+V** (or  on its bar). The toolbar also has **Measure**, **Zoom in**, a **Hide** menu and a **Remove** menu.

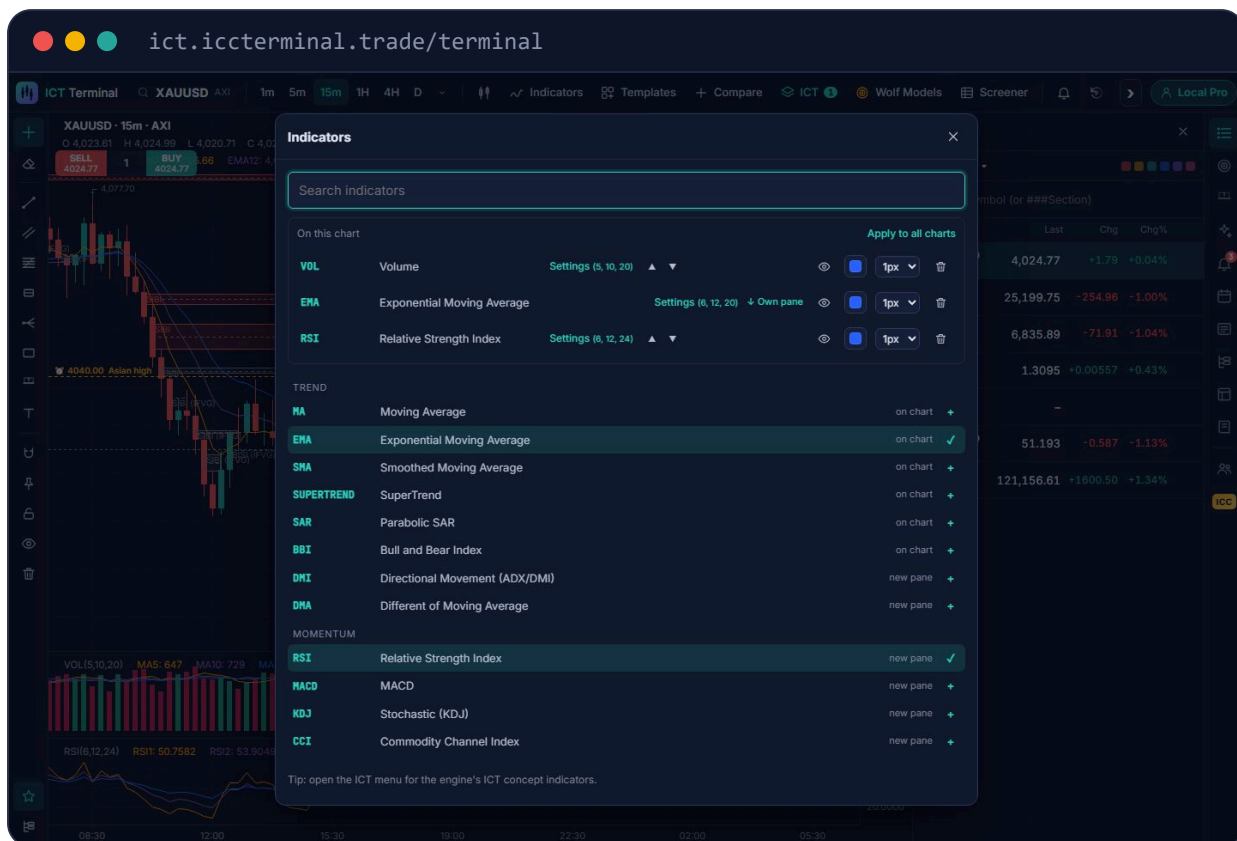

08

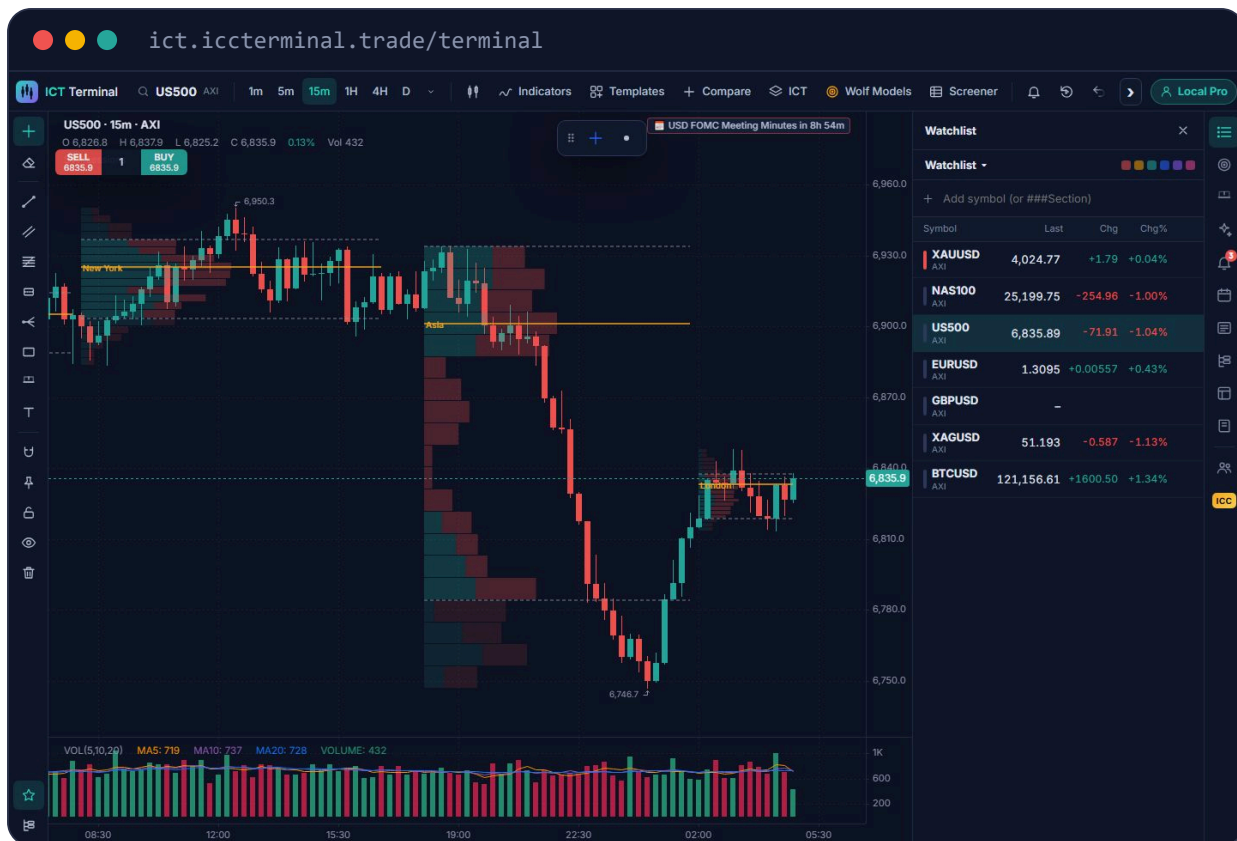

Indicators, volume profiles and ICT Script

- **Indicators** in the top bar: about 30 indicators (moving averages, VWAP, SuperTrend, Bollinger, RSI, MACD, ATR, volume and more). Search, add, and in **On this chart** change settings, colour, width, hide or remove.
- Price indicators (moving averages, VWAP ...) can move into their own pane with **↓ Own pane** and back with **↑ On price**; pane indicators (RSI, MACD, volume) move up and down with **▲ ▼**.

- **Volume profiles:** VPVR (visible range), SVP (one profile per session or per day) and the fixed range drawing, each with the point of control (POC) and the value area.
- **Apply to all charts** copies the indicators of the active chart to every chart.

Indicators: search, add, change settings, colour and width, move between the price chart and its own pane.

Session Volume Profile: one profile for Asia, London and New York with the point of control.

ICT Script: your own indicator

In **Indicators** → **My scripts** → **+ New script** write a few lines, for example:

```
fast = ema(close, 9) · plot(fast, "EMA 9")
```

- Values: `open high low close volume hl2 hlc3 ohlc4` ; `close[1]` is the previous bar.
- Functions: `sma ema rma wma rsi atr highest lowest stdev change abs max min` ; up to 6 `plot()` lines; `@pane` on the first line draws it in its own pane.
- The check below the editor shows errors with the line number. **Save and add to chart** keeps it in your account.

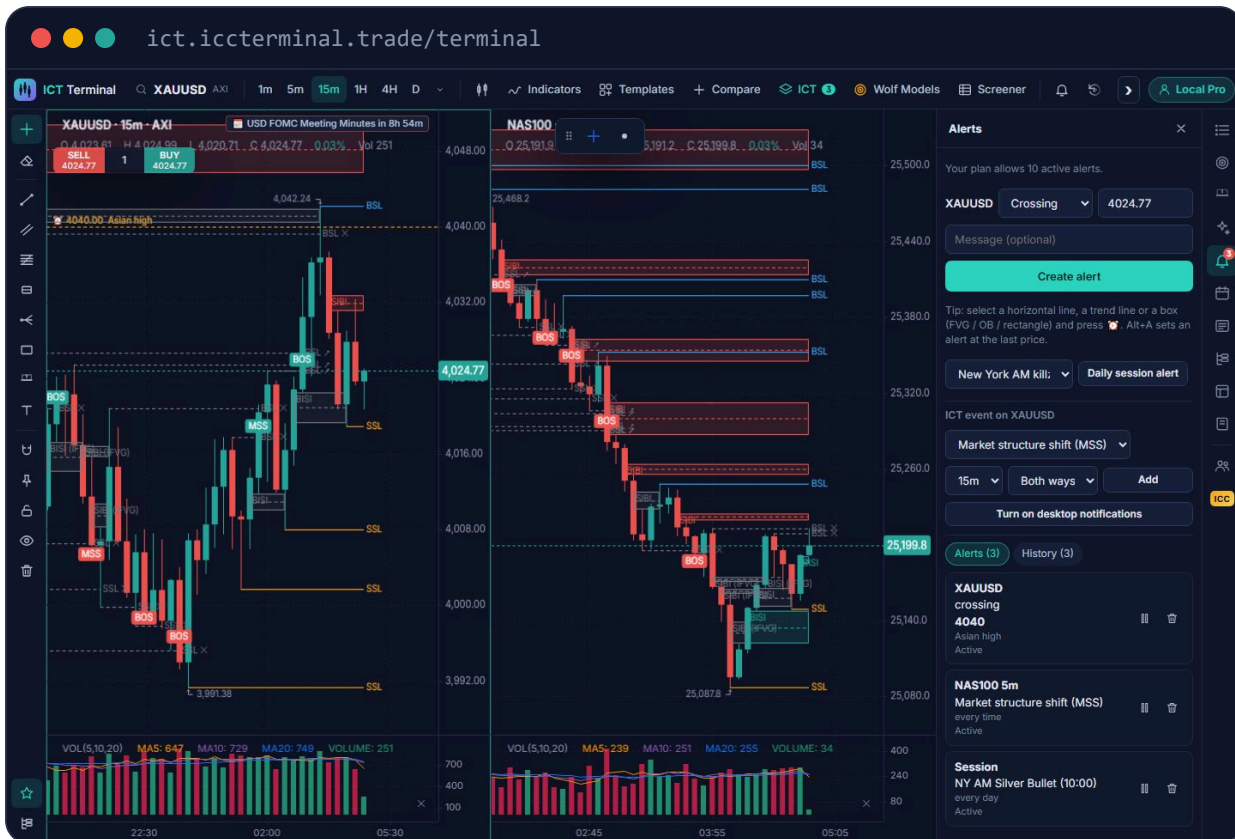

Supertrend (cTrader): the same indicator as cTrader's (Periods 10, Multiplier 3, Wilder ATR): green dots under the price in an up trend, red dots above it in a down trend. **Period separators** (Settings → Events) mark the day, week, month or year like MT5 (Auto picks it by timeframe).

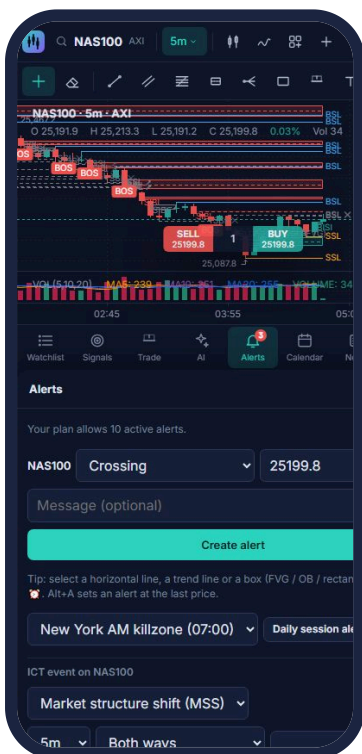

09

Alerts and WhatsApp

Open **Alerts** on the right. Alerts work while the terminal is open on any of your devices; WhatsApp alerts are sent by the server.

The **Alerts** tab: price alerts, a daily session alert and an ICT event alert (MSS on NAS100 5m).

Alerts on the phone.

Alert	How to create it
Price	Enter a price and choose Crossing , Above or Below . Alt+A sets one at the last price.

Alert	How to create it
Trend line / zone	Select a trend line, a box, an FVG or an order block on the chart and press  .
Session	Pick a session (killzones, Silver Bullet windows, New York open) → Daily session alert . It fires every day.
ICT event	Under ICT event : MSS, BOS, new FVG or liquidity sweep, an interval (1m–4H) and a direction. It fires on every new event.

Setups on WhatsApp

1. In **Alerts** → **WhatsApp alerts** enter your number in international format, digits only (for example **923001234567**).
2. Choose the lowest grade, and if you like only some models or symbols, and whether only setups with the bias count.
3. Turn on **Auto notify**, save, and press **Test**. Each new setup is sent once; plans with a delay send it after the delay.

✓ Turn on desktop notifications (the button in the Alerts tab) so you hear alerts even in another window.

10

Paper trading

Practise without real money. The paper account starts with 10,000 USD (you can reset it with any balance).

Paper trading: the **Trade** tab and the one-click SELL / BUY buttons on the chart.

1. Open **Trade** on the right, or use the **SELL** / **BUY** buttons on the active chart with the quantity between them.
2. Choose **Market**, **Limit** or **Stop**, the quantity, and an optional **Stop loss** and **Take profit**. Risk, reward and R are shown before you place it.
3. Positions and orders are drawn on the chart. Drag the SL, TP or order line to move it.
4. Close with **×** in **Positions**; finished trades are in **History** with the P&L and the win rate.

i Orders are filled by the server on 1-minute bars: limit and stop orders fill at their price, a gap fills at the open, and when one bar touches both the stop and the target, the stop counts first.

MT5 auto-trading: in the **MT5** tab choose the models, symbols, grade, daily bias, sessions, days, trades a day and risk for your EA, and see how the signals of the last 7 days pass them. Press **Take a tour** there, or read the [auto-trading guide](#).

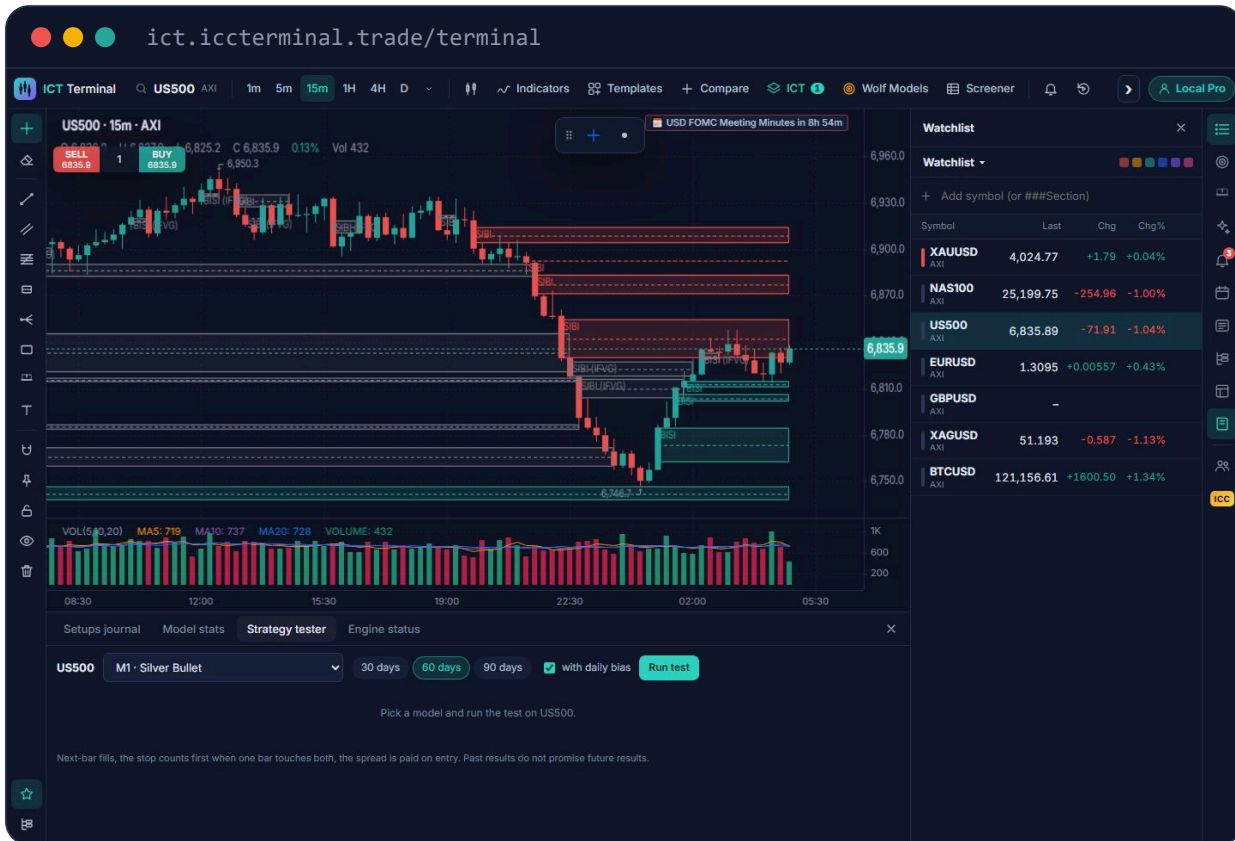

Risk calculator (like cTrader): in the Trade tab (or right-click → *Risk calculator*) give the balance, the risk in % or money, the entry and the stop (pips or price) and the take profit (R, pips or price): you get the lots, the units, the money at risk, the reward and the R:R. *Draw on the chart* makes a Long / Short position from it; *Buy / Sell (paper)* places the paper order.

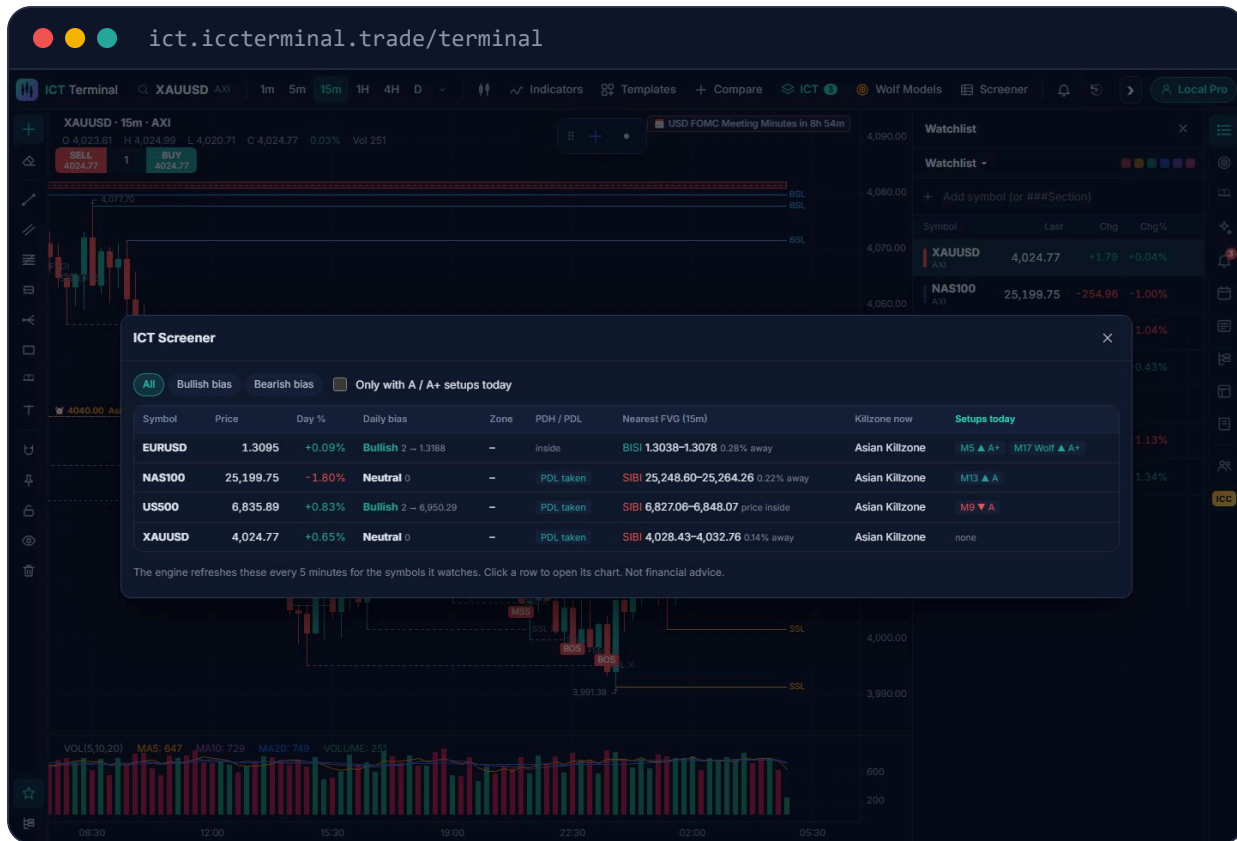

11

Strategy tester and screener

Strategy tester

The **Strategy tester**: a model on the active symbol over 30, 60 or 90 days.

The **Screener**: bias, premium / discount, sweeps, FVGs and today's setups of every symbol.

1. Open the bottom panel (the journal button on the right menu, or settings → **Journal & stats panel**) and choose **Strategy tester**.
2. Pick a model, 30, 60 or 90 days and whether the daily bias is required, then **Run test**.
3. You see the setups, fills, win rate, average R, total R, profit factor, the largest drawdown, an equity curve and every trade (click one to see it on the chart).

Screener

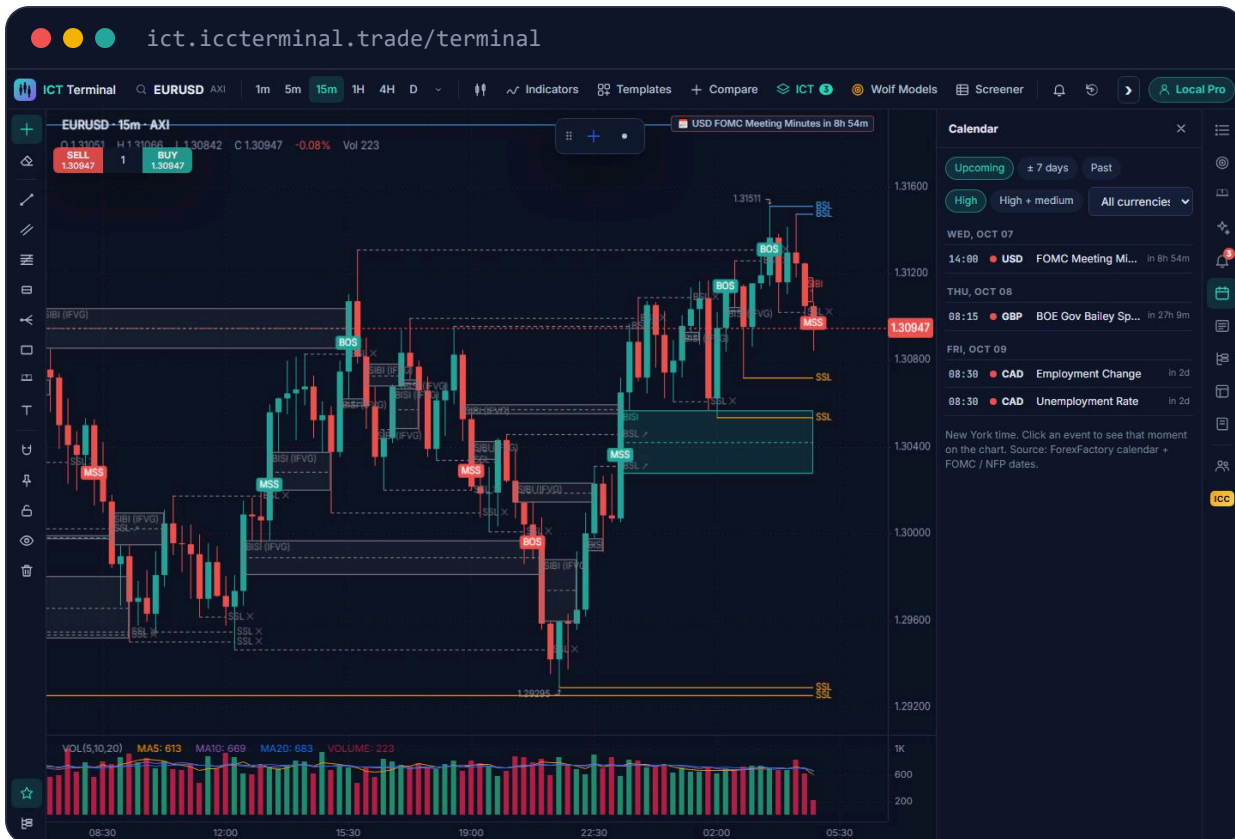

Screener in the top bar shows every symbol in one table: daily bias, premium or discount, sweeps of the previous day's high / low, the nearest 15m and 1H FVGs, the killzone now and today's setups. Click a row to open that chart.

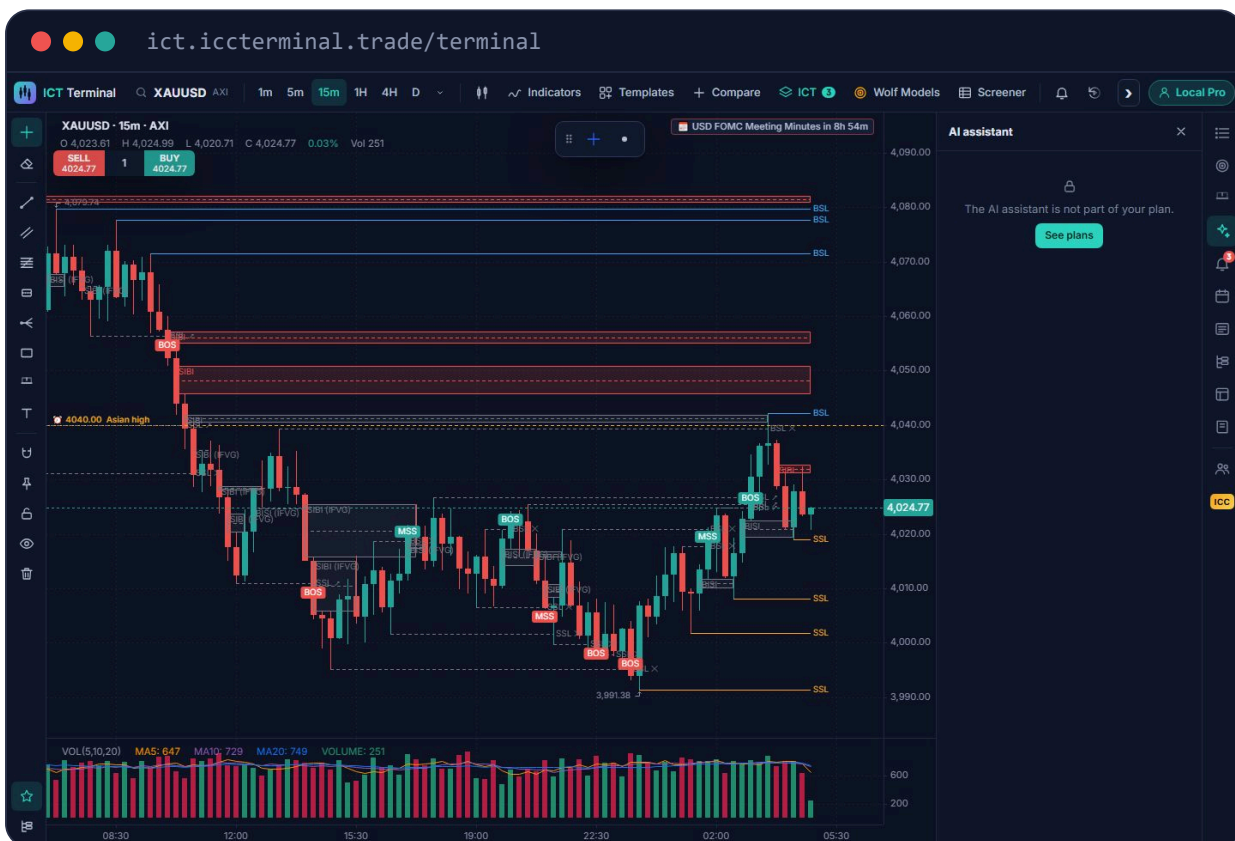

12

Calendar, news and the AI assistant

- **Calendar**: the economic events of the week with impact and currency filters; click one to see its time on the chart. High-impact news also shows as a mark on the chart and a countdown tag.
- **News**: the latest market headlines.
- **AI**: ask about the active chart — bias, key levels, liquidity, open gaps, the latest setups and their time. It answers in English or Roman Urdu from the engine's own data.

The economic **Calendar**: click an event to see its time on the chart.

The **AI** assistant answers about the chart you are on, in English or Roman Urdu.

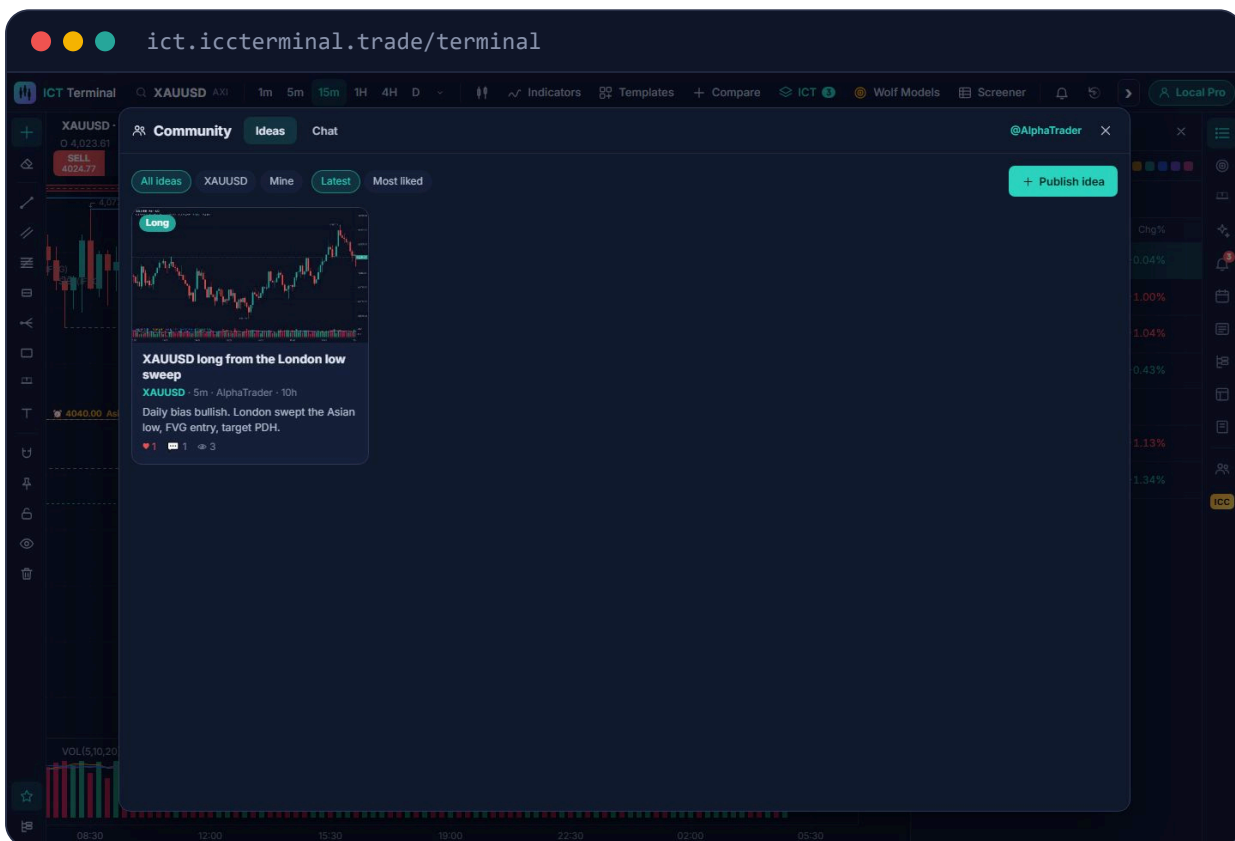

⚠ Models do not open new trades around high-impact news (15 minutes before and after), and on FOMC days positions are closed before 14:00 New York.

13

Community and ICC Terminal

- **Community** (right menu): share a trade idea with a picture of your chart, like and comment on ideas, and chat in the rooms. The same ideas are on the website.
- Choose a nickname and accept the rules the first time. Reports go to the moderators.
- **ICC** (right menu): opens ICC Terminal next to your charts with its own login — docked, full screen or in a new tab.

Community: trade ideas with chart pictures, likes, comments and chat rooms.

14

Phone and tablet

- On a phone the tools are on top, the charts in the middle and the menu (Watchlist, Signals, Trade, AI, Alerts ...) at the bottom; slide the bottom menu sideways for Community and ICC.

- With 2–8 charts, **All** shows every chart on the screen, **One** shows one at a time with chips to switch.
- Tablets in portrait show up to 8 charts in two columns.
- Pinch to zoom, drag to scroll, long-press for the crosshair; drawing works with the finger.

The terminal on a phone: two charts stacked, tools on top, the menu at the bottom.

Android app 0.4: the app is the whole web terminal, with a fingerprint lock (Account → This phone), the phone's back button, Google sign-in in your browser and sharing of chart pictures. Side panels open as a sheet over the chart.

App 0.4.1: the Google / Facebook sign-in opens on top of the app and the app comes back by itself once you press Continue. The terminal's files stay cached on the phone, so the app opens faster.

15

Plans and your account

- The account button at the top right shows your plan, its expiry and what it includes (charts per layout, ICT indicators, models, signal delay, alerts, backtests).
- **Upgrade or renew:** choose a plan and pay with one of the methods shown (bank / wallet transfer with the transaction ID, or crypto). The plan starts when the payment is confirmed.
- **Devices:** your account lists the devices you use; a plan allows a set number of them at the same time.
- **Security:** change your password there; use **Forgot password?** on the login page if you lose it.

16

Keyboard shortcuts

Keys	Action
A–Z	Symbol search
0–9	Interval (type a number)
Alt+T / Alt+H / Alt+F / Alt+R	Trend line / horizontal line / ICT Fibonacci / rectangle
Alt+A	Alert at the last price
Alt+G	Go to date
Alt+S	Screenshot
Ctrl+Z / Ctrl+Y	Undo / redo
Del	Delete the selected drawing
Esc	Cancel the tool or close a window
Shift + click	Quick measure

17

Questions

The chart is empty or stops updating.

Check your internet, then reload the page. If one symbol has no data, the broker feed may be closed (weekend) or busy for a moment.

I see a lock on a model or layer.

Your plan does not include it. Open the account button → **Upgrade or renew**.

My drawings are gone.

Drawings are saved with each chart a few seconds after you draw. Check that you are logged in to the same account and that the drawing is not hidden for this interval (**Visibility**).

Does it trade for me?

Only through the MT5 bridge (ICT Bridge EA) on your own MetaTrader 5 account, for approved models and plans that include it. Start on a demo account.

18

Risk warning

Trading CFDs, forex, indices and crypto with leverage carries a high risk of losing money quickly. ICT Terminal is an analysis and learning tool, not financial advice. The models follow fixed rules and many setups lose; past results do not promise future results. Only trade with money you can afford to lose.

ICT Terminal is a charting and analysis tool for education. It is not financial advice. Trading CFDs, forex, indices and crypto carries a high risk of losing money.
